

The PPI Herringbone Wing was designed for those applications where conventional wings suffer from excessive material lodging and wing folding. The extreme wing angles of up to 45°, use the pulleys rotation to eject material out the sides of the pulley rather than recirculating it as a conventional wing often does. These extreme angles and optimized wing height, along with a center reinforcement disc, all combine to make an incredibly strong design that excels where others fail.

FEATURES AND BENEFITS

- Wing angles of up to 45°
 - Provide unmatched expulsion of material and wing folding resistance
 - Allow multiple points of contact with wider gaps to further reduce the chance of material entrapment
- Radius crown design applies less stress on the belt for increased belt life, while still providing belt tracking capabilities
- A center reinforcement ring increases wing strength
- AR Bar or ContinuWing® are available for high-wear applications
- Available in diameters of 12" to 60" and face widths of 12" to 78"
- Available in two classes to better match application requirements:
 - Herringbone Wing (HBW) – use in more abusive applications
 - CEMA Herringbone Wing – entry level design
- Available in XT or keyless locking assemblies
