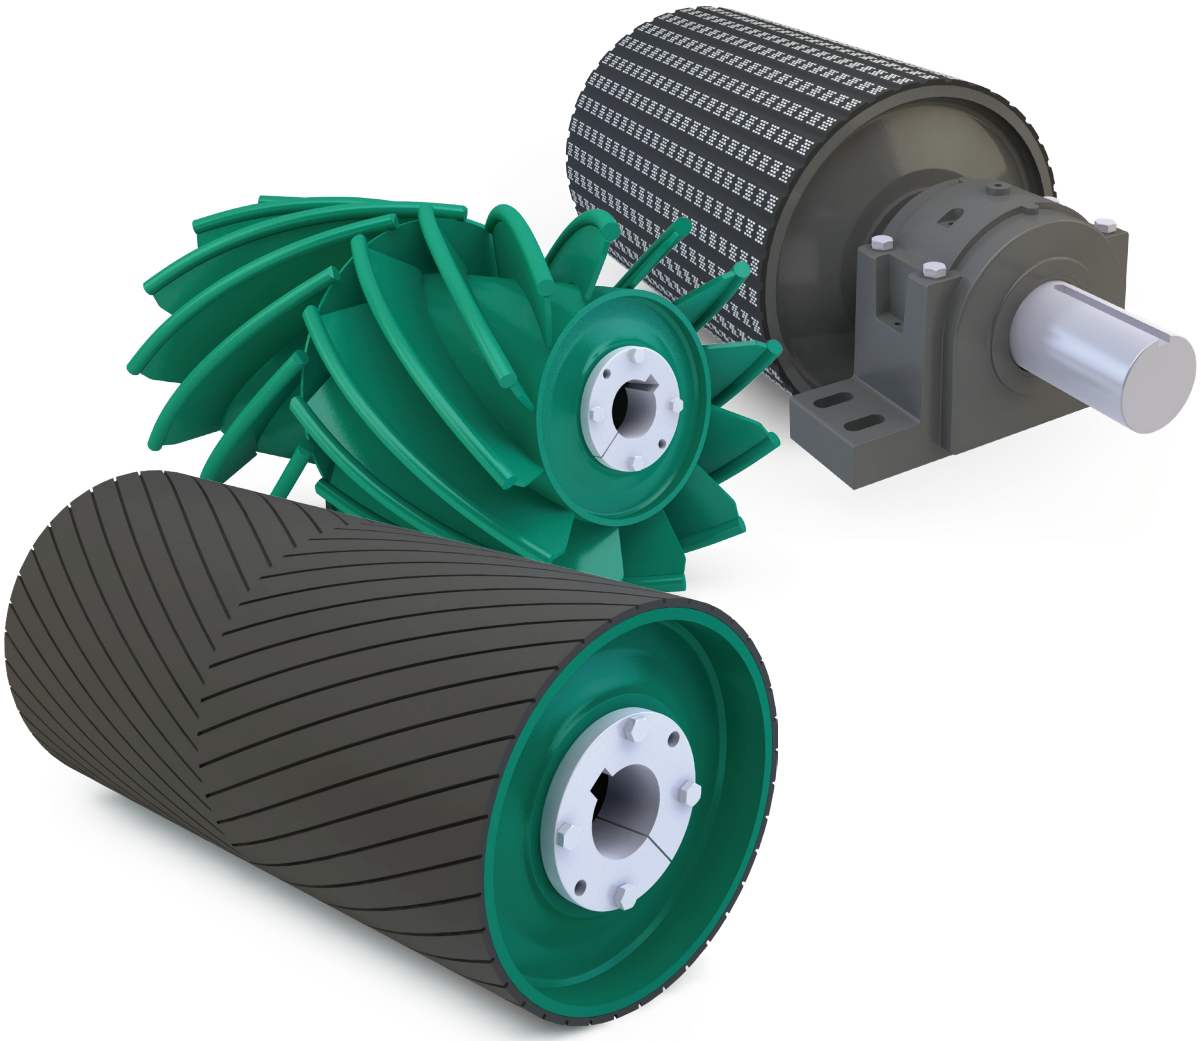
ENGINEERING & DIMENSIONS

CONVEYOR PULLEYS – BULK MATERIALS

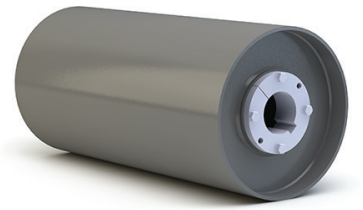


PRECISION PULLEY & IDLER

TABLE OF CONTENTS

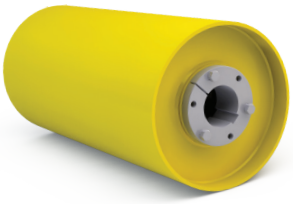
PRO DUTY®

All Pro Duty pulleys feature profiled end discs similar to that found in high tension Turbine pulleys. Profiled end discs are shaped from a solid piece of steel allowing the hub to be machined into it rather than welded in. Welded hubs are the most common failure point for drum pulleys, so reliability is increased dramatically with profiled end discs. In addition, bushing problems and shaft walking are reduced because loading stresses are distributed across a profiled end disc more efficiently.



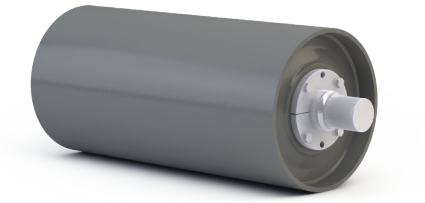
HEAVY DUTY DRUM PULLEY

The toughest conveyor applications require ruggedness offered by a HDD. Steel rims, hubs and discs are fused into an integral component by a continuous submerged arc welded bond that maximizes pulley strength, balance and concentricity. The HDD is available with various hub and bushing systems.



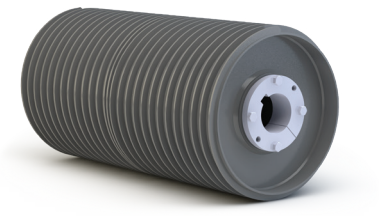
MINE DUTY DRUM PULLEY

PPI Mine Duty Drum pulleys incorporate heavier rims and end discs for increase service life and safety factor. Suited for more demanding applications, such as frequent starts and stops with a loaded belt or where increased reliability is desired.



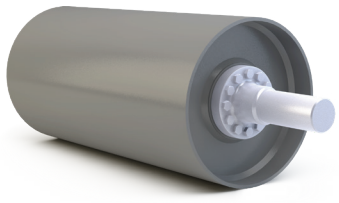
ENGINEERED CLASS DRUM PULLEY

PPI Engineered Class pulleys are supplied with various hub and bushing systems including keyless locking devices which are common on high tension steel cable belt systems.



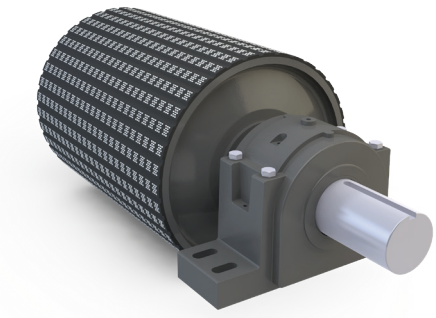
SPIRAL DRUM PULLEY

The PPI Spiral Drum pulley is formed by a pair of vertical steel bars helically wound around a Heavy Duty Drum (HDD) pulley. This unique design is frequently used when additional cleaning action is desired without introducing additional belt vibration. Rotation of the pulley automatically starts the cleaning action by discharging foreign material to the side of the conveyor.



EZ MOUNT PULLEY SYSTEM

EZ mount is a unique pulley and shaft system that allows for fast and economical bearing and shaft replacement without removing the pulley from the conveyor. It reduces maintenance and replacement time by using rugged engineered stub shafts. The exclusive PPI EZ Mount Pulley and shaft system are manufactured to CEMA standards and Mine Duty specifications.



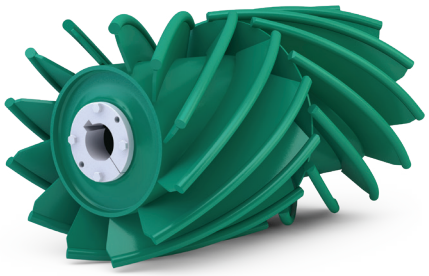
TURBINE PULLEY

Today's efficient high tonnage mines demand dependable long life components. Using state of the art engineering and design techniques, such as Precision Finite Element Analysis, PPI meets these needs by controlling material stress points. Incorporating all of the benefits of PPI's proven experience in heavy mining pulleys, the turbine offers our customers world class performance and reliability.

HERRINGBONE WING®

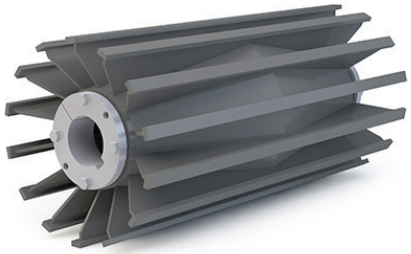
The PPI Herringbone Wing® was designed for those applications where conventional wings suffer from excessive material lodging and wing folding. The extreme wing angles of up to 45 degrees, use the pulleys rotation to eject material out the sides of the pulley rather than recirculating it as a conventional wing often does. These extreme angles and optimized wing height, along with a center reinforcement disc, all combine to make an incredibly strong design that excels where others fail.

Also available in a CEMA Herringbone Wing version ideally suited for less demanding applications.



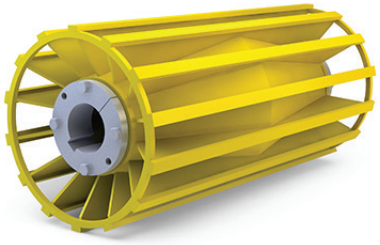
HEAVY DUTY WING PULLEY

Pulley and belt life are extended by the self cleaning action employed by the PPI Heavy Duty Wing pulley. Individual, all steel wings and gussets expel excessive build up of material from the area of belt contact which enhances traction and reduces abrasion of both belt and pulley. Where abrasion and excessive build up conditions exist, the HDW pulley with self cleaning action provides an excellent alternative to conventional drum style pulleys. Available with various hub and bushing systems.



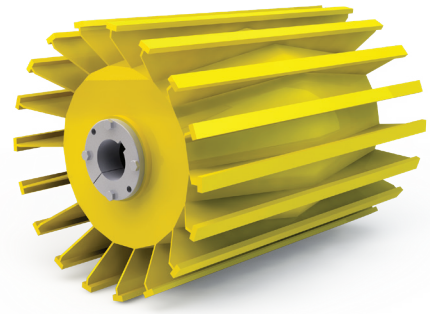
MINE DUTY WING PULLEY

Demanding wing pulley applications call for PPI Mine Duty Wing pulleys. Mine Duty Wing pulleys provide effective self cleaning action that reduces excessive material build up. The extra heavy duty construction reduces the possibility of metal fatigue and enhances the dependability of the pulley. Ideally suited for harsh application and for very abrasive conditions.



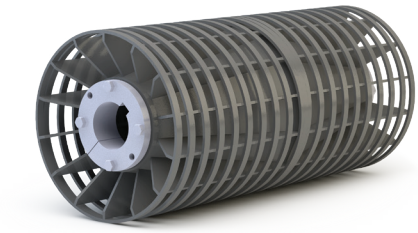
QUARRY MAX DUTY WING PULLEY

The Quarry Max Duty Wing pulley is made for severe applications where wing folding and abrasion issues are a concern. It has massive contact bar and thick wings. The Quarry Max Duty Wing resists wing folding by utilizing an end disc when necessary to keep wing heights ideal, short enough to resist folding, long enough to provide adequate rigidity. Ideally suited for harsh applications and for very abrasive conditions.



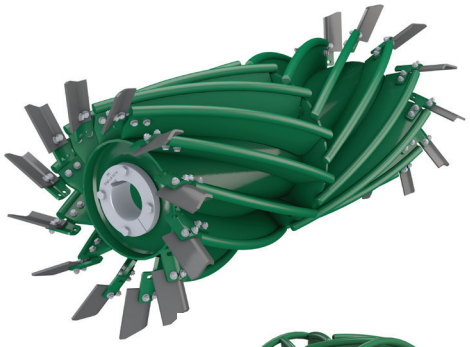
SPIRAL AND SPIRAL PLUS WING PULLEY

The PPI Spiral Wing and Spiral Plus Wing pulleys are formed by winding flat bar spirally from the center of a wing pulley to the outside ends. This continuous belt contact design eliminates excessive noise and vibration, while still providing a cleaning effect and allowing a path for debris to escape rather than being trapped between the pulley and belt.



GRAIN HERRINGBONE WING CONVEYOR PULLEY

PPI's Grain Herringbone Wing combines improved wear, quieter operation and gentle grain handling compared to standard wing pulleys. It has more wings to support thin grain belting and it has rubber flappers to lift grain and throw it back on to the belt in enclosed conveyors.



BOOT HERRINGBONE WING CONVEYOR PULLEY

The patented PPI Boot Herringbone Wing pulley combines improved wear, quieter operation and gentle grain handling, along with a sensor ring for use with proximity or heat sensors.

SINGLE DISC ELEVATOR PULLEY (SDE)

A continuous weld of the disc to the rim, coupled with heavy duty construction and a high compression hub and bushing, provides a one-piece, all steel, single disc pulley capable of reducing stress and deflection.

Single Disc Elevator pulleys (SDE) are constructed with a standard crown face and XT hubs unless otherwise specified.

SDE pulleys are also available with other hub and bushing systems.

LAGGING FOR DRUM CONVEYOR PULLEYS

PPI has complete in-house pulley lagging capabilities. Every step of the pulley manufacturing and lagging process is controlled internally, which assures quality, prompt delivery and competitive pricing of lagged pulleys. Available in a wide variety of styles and thicknesses, lagging is primarily used to improve traction capacity, resist abrasive conditions and extend pulley and belt life. The style of lagging required is usually influenced by operating conditions. While the standard is 60 durometer, it is available in various durometers, with 45 and 70 being common alternates. SBR is standard; Neoprene and MSHA are available as well as a wide variety of other compounds.

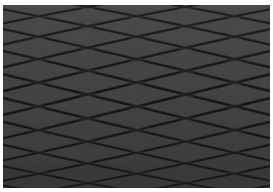
Other lagging is available for specific applications. An example of this is roughtop lagging. This is used for small diameter drive pulleys. It is created by lagging the pulley, but before the rubber is cured, a special mold is applied to cause the grooves to be formed in the lagging. It is then cured with this form in place. It gives excellent traction, without cutting grooves. By forming the groove in the lagging, PPI can offer roughtop on thin lagging, such as 1/4". Consult the factory for your specific requirements.

HERRINGBONE GROOVE LAGGING (HBG)

The style of lagging required is usually influenced by operating conditions. This style grooving is where the points do not meet in the middle. This is normally used in drive pulleys, with the V pointing in the direction of rotation. (3/8" minimum thickness)

CHEVRON GROOVE LAGGING (CHE)

Some prefer having the points meet, as done in Chevron. This is also used primarily on drive pulleys. (3/8" minimum thickness)



DIAMOND GROOVE LAGGING (DIA)

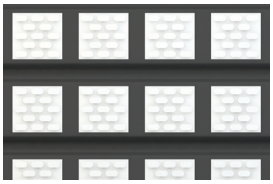
Diamond, or double HBG, or double chevron is primarily used for reversing conveyor drive pulleys. It is also often used for spare pulleys when one doesn't know the direction of rotation. (3/8" minimum thickness)

CIRCUMFERENTIAL GROOVE LAGGING (CIR)

This is used on non drive pulleys in very wet applications or cold temperatures. It allows the lagging to deflect, keeping material from building up on the lagging.
(3/8" minimum thickness)

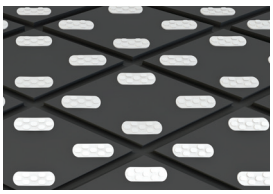
ALIGNER GROOVE LAGGING (LOR)

This is a Lorig style lagging. Lorig is used on flat face pulleys, the lagging is machined flat, then grooves are machined in at an angle. This results in a training action. As the rubber is compressed by the belt, the lagging will deflect towards the center, helping to track the belt. (3/4" normal thickness)



CERAMIC LAGGING

Ceramic lagging is ceramic tiles molded into a rubber compound. This makes for excellent traction, reducing slippage and offering excellent abrasion resistance.



VULCANIZED ENGINEERED CERAMIC LAGGING (VEC)

Our patented VEC lagging starts with SBR or Neoprene lagging that is hot vulcanized on a pulley. Our uniquely designed tiles are then embedded in the vulcanized lagging. This design eliminates seams, where failures often start. This process allows flexibility in tile coverage and grooving patterns.

CRAFT-LAG®

Craft-Lag is bonded to rigid backing, which is then formed to a specific diameter. Craft-Lag can be used with or without retainers and is ideal for mining, crushed stone, sand and gravel, cement, agriculture, food processing, coal mining, power plants, feed and grain, and general industry.

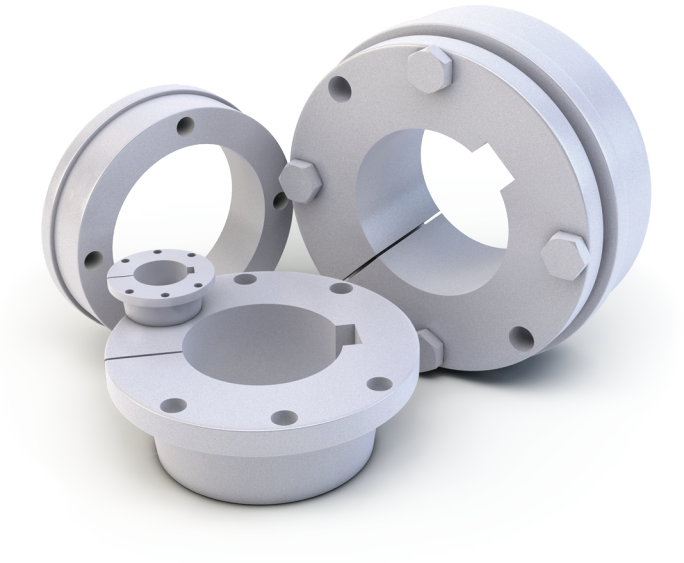
* Requires a stamp for MSHA approval.

- Use a flame resistant lagging in all grain or underground applications.
- Use a static conductive lagging in all applications with grain or material containing explosive dust.
- FDA approved for food grade application.

XT® Hubs & Bushings were computer-designed and specifically developed for conveyor pulley applications. This design utilizes a tapered bore bushing that provides all the holding power you'll ever need for conveyor pulleys and allows easier installation and removal than other bushing types.

- Designed for conveyor pulley applications
- 2" per foot taper
- Self-seating – no need to hammer bushing in
- Less axial movement – reduces end disc stress and seats quicker
- High clamping force eliminates need for keyway on non-drives
- Bolts equally spaced for even draw-up
- More material in the barrel
- Full length hub engagement
- Flange deflection stores up capscrew torque for seating while running
- Easy removal
- Full size keys in max bores for size 50 and larger



PPI offers the XT® with larger hub diameters and longer hubs for greater load capacity.

PPI has found that the XT® taper and heavy barrel are best suited to our design philosophy and recommends them for pulley hub usages. For metric key sizes, please see our website at www.ppi-global.com, just click on Resources, then Catalog/Product Sheets and scroll down to XT® charts.

QD® has a primary benefit of bushing interchangeability with other shaft mounted components. Its shallow taper provides a high mechanical advantage to assure dependable clamping to the shaft.

- Designed for a wide variety of applications
- 3/4" per foot taper - self-seating
- High clamping force eliminates need for keyway on non-drives
- Flange deflection stores up capscrew torque for seating while running

*Max bore of QD hubs is the maximum recommended for 2 hub assemblies, such as conveyor pulleys

- Keys are provided for shaded cells only, (non-standard key sizes)
- Subject to change without notice
- Unshaded keysizes are FULL depth keys
- For metric key sizes, please go to www.ppi-global.com/resources/catalogs and scroll down to XT® and QD® Hubs

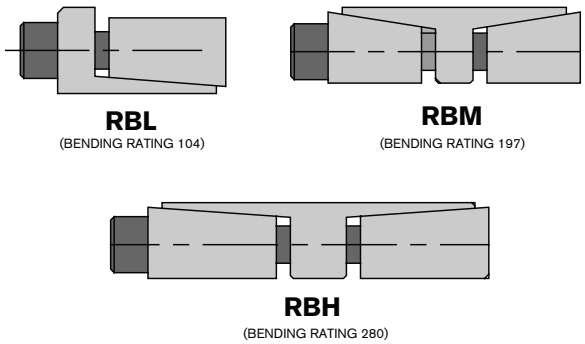
The standard in keyless locking assemblies is the RBL, it is self-centering, and no pilot bushing is needed. The single taper design is better able to handle the bending moment present in pulley applications. For high-tension applications, Precision Pulley & Idler recommends the RBM and the RBH. The graphic shows the relative difference in size and bending moment for each series.

The chart to the right gives a range of standard sizes and the relative torque ratings. This is a representation of the sizes that are commonly available. Nominal inch as well as metric sizes are also available for shaft sizes under 8 inch. For special applications, PPI works with the vendor to engineer an appropriate locking assembly designed just for that application.



LOCKING ASSEMBLY	ALLOWABLE BENDING MOMENT
RBL	28%
RBM	32%
RBH	35%

- Allowable bending moment as a percentage of torque rating of the locking assembly
- Shaft diameters below 8 inch are usually available in nominal inch sizes
- This is a partial list of available series and sizes

PPI HUB	COMPATIBLE LOCKING ASSEMBLIES

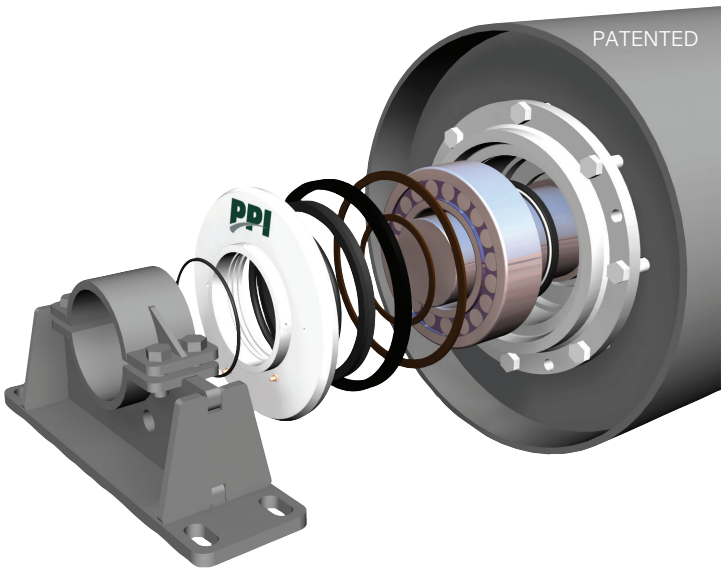
- Static shaft for increased reliability
- Standard spherical bearing
- Self-aligning bearing transfers load to the shaft
- Self-aligning bearing does not transfer bending load into the pulley
- Reduces bending stress on critical weld joints
- Bearing is protected by dual contact seals
- Stationary grease fittings
- Maintenance friendly hub bolts with back-out holes
- Welded steel mounting blocks
- Standard mounting pattern for drop-in replacement
- Available in various pulley styles for non-drive, non-brake, non-backstop pulley locations
- For other sizes and styles contact your local PPI Representative



SIZE	BORE	SIZE	BORE

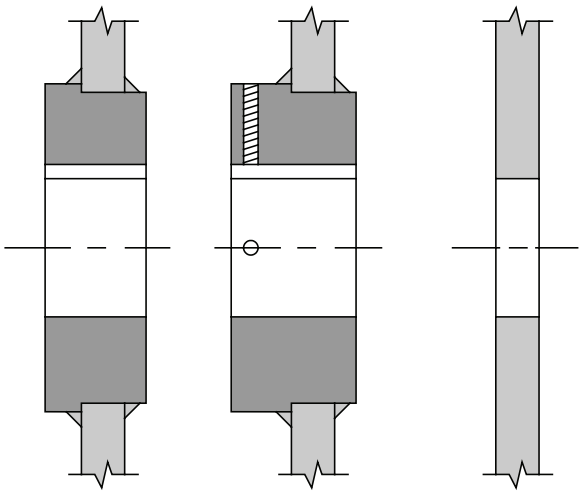
030	5.906	156	11.024
032	6.299	160	11.811

PPI offers several other styles to fit your particular needs. These include, but are not limited to, Press Fit (interference fit with keyway), Fixed Bore (solid bore, clearance fit with keyway and setscrews), and Weld-in (no hub, welded to the shaft). For more information on these and other means of attaching a pulley to a shaft, contact your local PPI representative.

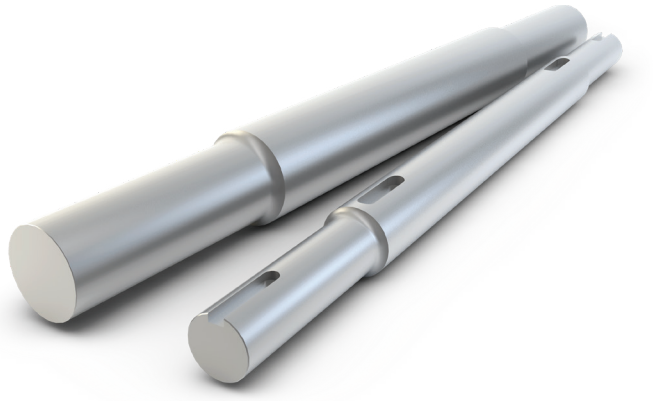


PRESS FIT

FIXED BORE
(SOLID BORE)

WELD-IN
(WELD END DISC TO SHAFT)

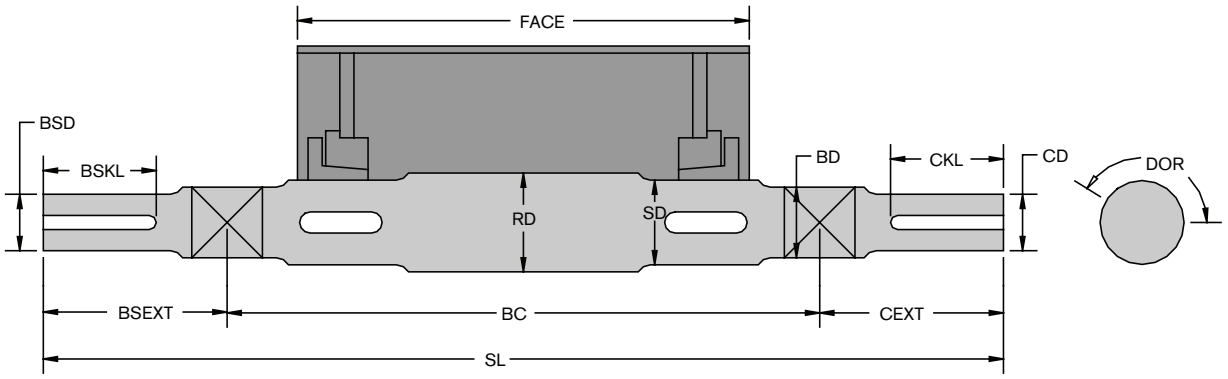
PPI conveyor pulley shafting is a vital part of the total pulley assembly. Standard PPI shafting is AISI 1045, which represents the higher carbon range in the open hearth carbon group. Excluding alloy steel, higher carbon content in a AISI 1045 results in one of the strongest steels in the carbon range and machines to a smooth finish. Normally, PPI uses T&P for shafting up through 5-15/16 inches. While, hot rolled and/or forged shafting (depending upon size, availability, and specifications) is used above a 6 inch diameter.



Other materials, including 1018 (used for welding compatibility), 4140, and 4340 (normally used for high stressed areas, such as drive extensions) are available upon request.

Shafting can be keyed or journaled to meet any specification.

PPI shafting capabilities cover the broad spectrum of our customers, from unit handling to some of the largest pulley shafts in the world, PPI can handle your needs.



PULLEY ID	IDENTIFICATION					
QTY	Quantity

DOR	Direction of Rotation					

1. **Determine effective tension that is supplied by the motor.** Te = HP * 33,000 / FPM.

2. **Determine slack side tension.** Using the K-factor from Table 1, multiply the effective tension (Te) by K to determine the slack side tension T2 = Te x K.

   This is the minimum T2 tension. You may have to add an additional safety factor depending upon your application or how you tension your belt, i.e. wire rope/screw/etc.

3. **Determine T1 or tight side tension.**
   T1 = T2 + Te
   (for dual drives, add the primary Te to the intermediate tension).

4. **Determine the angle of wrap for each pulley.**
   If unknown, use 180 for tail, take-up, and un-snubbed drives. Use 210 for snubbed drives, 30 for snubs and 90 + the incline angle for bend pulleys.

5. **To determine the resultant load** on non-drive pulleys, multiply the belt tension at that pulley by the resultant load factor in Table 2 for that pulley wrap. Then R = T2 x Factor.

6. **For Drive pulleys, divide the T1 by T2.** Use this ratio and Table 4 to determine the drive pulley resultant load factor. Then R = T2 x Factor.

7. **Determine Face Width.** For belts up through 42 inches add 2 inches to the belt width. For belts 48-60 add a minimum of 3 inches to the belt width.

8. **Determine the shaft size** by using Table 5 or Table 6. Subtract the face width from the bearing centers (BC – F). Follow the proper pulley face width column and across from the bearing center minus face value (interpolate if correct amount is not listed) until the load rating is greater than the resultant load determine above. Follow this procedure for each pulley.

9. **For pulley diameters, check with your belt manufacturer.**
   The belt requirements are the single largest consideration when choosing a pulley diameter.

10. **Divide the tension at each pulley by the belt width to get the PIW for each pulley**, (for the drive use T1) and check this against Table 3, XPD & MDD. If the PIW exceeds the rating for a XPD consider the MDD or increase the diameter. If this results in a pulley that does not fit into your conveyor, please contact PPI Engineering.

XPD1226PXT30

- Pulley Type
  - XPD - Drum
  - MDD - Mine Duty Drum
  - XPW - Wing
  - MDW - Mine Duty Wing
  - QMW - Quarry Max Wing
  - XPS - Elevator (Single Disc)
  - XPU - Unit (formed crown tube)
  - XPT - Tube (machine crown)
- Pulley OD
  - Standards are:
  - 04 to 06 by 1 inch increments
  - 08 to 20 by 2 inch increments
  - 24 to 60 by 6 inch increments
- Pulley Face Width
  - Standard are:
  - 06 to 46 by 2 inch increments
  - 51 to 66 by 3 inch increments
- Hub Type & Size

X250207

- XT Bushing Type
- XT Bushing Size
  - 15, 20, 25, 30, 35, 40, 45, 50, 60, 70, 80,
  - 10 for 100, 12 for 120
- Shaft Size in sixteenths of an inch
- Shaft Size in inches

QSF0207

- QD Bushing Type
- QD Bushing Size
  - SF, E, F, JS, MS, NS, PS, WS, SS, ZS
- Shaft Size in sixteenths of an inch
- Shaft size in inches

STANDARD CROWN FACE

PPI's standard face style is a full crown where the OD increases by 1/8" per foot from the edge to the center of the pulley.

HIGH CROWN

Used on narrow face widths such as elevator pulleys. The crown extends across the entire pulley face similar to standard crown, however the crown rate is 50% to 100% more for better belt tracking.

EDGE OR END CROWN

This is a partial crown, commonly used on tube pulleys. The pulley crown is machined only on the edges at the standard crown rate. The center of the pulley is left unmachined.

TRAP OR TRAPEZOIDAL CROWN

This is a partial crown, also used on tube pulleys. However, the entire face of the pulley is machined for better TIR throughout before crowning the ends at the standard crown rate.
